Usable Bundle Size

This experiment determines the usable bundle size for given hyperparameters {N,P}.

Test setup:

- Prefill auto-associative memory with 5 million items.
- For a given bundle size b, randomly select b items from the prefill data.
- Query the memory with the stochastically decimated bundle until an item from the bundle emerges.
- Repeat and compute the median number of queries, needed to extract the first item.

We define the usable bundle size as the number b for which the median number of query attempts is 1 or 2.

The result depends on the decimation factor.

Requirements

```

```

Hyperparameters

```
7
```

Test Setup

```
SeedRandom[1];
```

```
RandomSet[n_,p_] := Sort[RandomSample[Range[n], p]];
```

```
extraction[ mem_, mult_Integer, p_Integer] :=
    Module[ {shots = 0, y, maxiter = 5 p, sample, bundle, decimate},

    decimate[s_List] :=
        If[ Length[s] > p, Union[RandomSample[s,
            Round[ decimation * Length[s] ]]], s];

    sample = RandomSample[ data, mult];

    bundle = Union[Flatten[sample]];

    Do[ shots++;
        y = mem["retrieve"][ DDD = decimate[bundle]];
        If[y =!= {} && MemberQ[sample, y], Break[]],
            {i, 1, maxiter}];

    shots
    ];
```

Experiment

```
M = Memory[ <| "A_parameters"→{n, p}, "B_parameters"→{n, p}|> ]
```

```
⟨|A_parameters → {2000, 10}, B_parameters → {2000, 10}, T → 7,
 residual → 2000, store → store$1850, retrieve → retrieve$1850,
 clear :→ clear$1850, memorycount :→ memorycount$1850, backend → C_FFI|⟩
```

```
prefill = 5000000;
data = Table[RandomSet[n,p], prefill];
M["store"] /@ data; // AbsoluteTiming
```

```
{374.628, Null}
```

```
M["memorycount"] / ( n^2 (n-1) /2.)
```

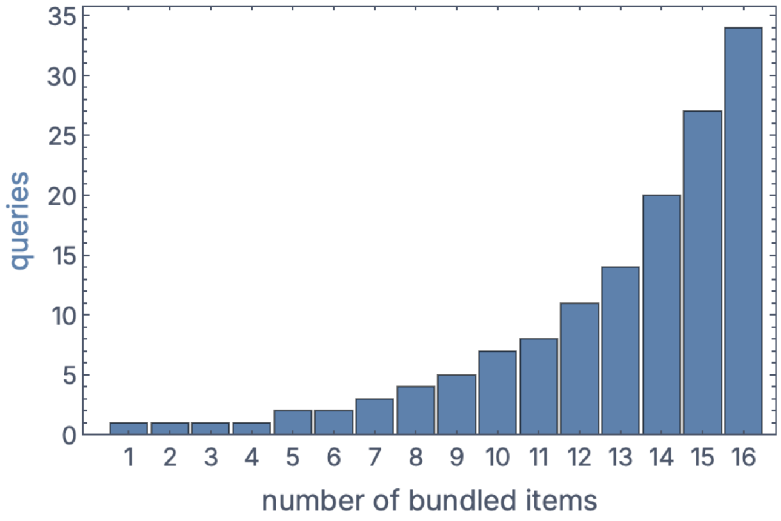

```
0.36343
```

```
testsize = 1000;
maxbundle = 16;
```

```
tab = Table[
    queries = N[Median[Table[ extraction[ M, i, p], testsize]]];
    Print[i, " | ", queries];
    queries, {i, 1, maxbundle}];
```

```
